# ASTRONOMY 1102-Section 1 <br> Instructor: Juhan Frank <br> Fall 1999 <br> Homework \# 1 due Wed. Sep. 8 <br> Powers of 'Ten, Mass \& Energy 

1) Calculate using powers of ten (without calculators) the length of a light-year, a unit of length commonly used for stellar distances, which equals the distance travelled by electromagnetic waves (take speed $=3 \times 10^{5} \mathrm{~km} / \mathrm{s}$ ) in one year (take $\left.1 \mathrm{yr}=3.15 \times 10^{7} \mathrm{~s}\right)$.
2) Assuming we are heading for a collision with M31, how long will it take for this to happen given that M31 is 2.5 million LY away and that we are travelling toward it at a speed of $80 \mathrm{~km} / \mathrm{s}$ ?
3) The average human needs 2500 Calories to cover his/her daily needs for energy. Supposing we could convert directly matter to energy according to $\mathrm{E}=\mathrm{m}$ c2, how long could we live off one kilogram of matter?
4) Compare the kinetic energies of a 1 ton ( 1000 kg ) car moving at a speed of $100 \mathrm{~km} / \mathrm{hr}$ with that of a 2 ton pick-up truck moving at $50 \mathrm{~km} / \mathrm{hr}$.
5) Explain why it is more dangerous to fall in a freezing lake than to stand naked in freezing air.
