

James Clerk Maxwell (1831-1879)

Maxwell's equations the dawn of 20th century physics

Gauss' Law:

*charges produce electric fields,
field lines start and end in charges*

$$\oint_S \mathbf{E} \cdot d\mathbf{A} = q / \epsilon_0$$

Gauss' law for magnetism:

field lines are closed

or, there are no magnetic monopoles

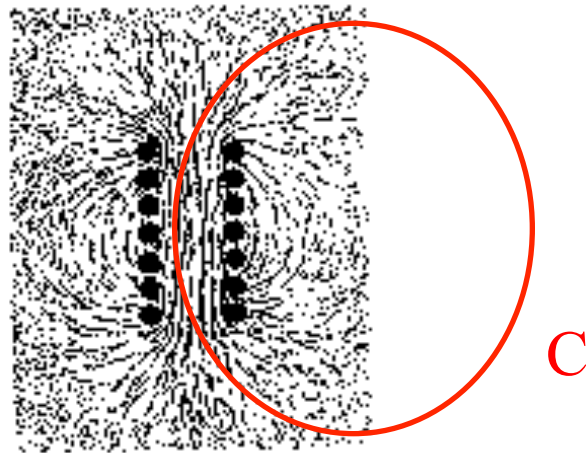

$$\oint_S \mathbf{B} \cdot d\mathbf{A} = 0$$

Ampere's law:

electric currents produce magnetic fields

$$\oint_C \mathbf{B} \cdot d\mathbf{s} = \mu_0 i$$

Faraday's law:

*changing magnetic fields produce (“induce”)
electric fields*

$$\oint_C \mathbf{E} \cdot d\mathbf{s} = -\frac{d}{dt} \int_S \mathbf{B} \cdot d\mathbf{A}$$

All together:

$$\oint_S E \cdot dA = q / \epsilon_0$$

$$\oint_S B \cdot dA = 0$$

$$\oint_C B \cdot ds = \mu_0 i$$

$$\oint_C E \cdot ds = -\frac{d}{dt} \int_S B \cdot dA$$

No charges or currents:

$$\oint_S \mathbf{E} \cdot d\mathbf{A} = Q / \epsilon_0 \quad q=0$$

$$\oint_S \mathbf{B} \cdot d\mathbf{A} = 0 \quad ? \quad i=0$$

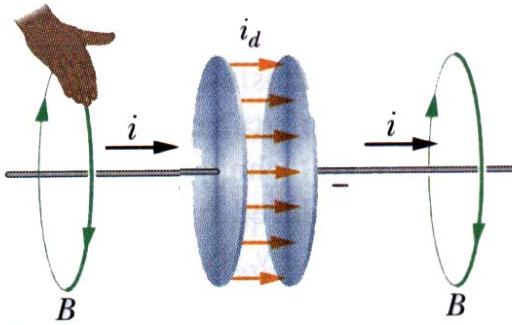

$$\oint_C \mathbf{B} \cdot d\mathbf{s} = \mu_0 i$$

...very suspicious...!

$$\oint_C \mathbf{E} \cdot d\mathbf{s} = -\frac{d}{dt} \int_S \mathbf{B} \cdot d\mathbf{A}$$

Something is not right...

If we are charging a capacitor, there is a current left and right of the capacitor.

Thus, there is the same magnetic field right and left of the capacitor, with circular lines around the wires.

There is an electric field inside the capacitor.
But no magnetic field there?

With a compass, we can verify there is indeed a magnetic field, equal to the field elsewhere.

But there is no current producing it! ?

Maybe we can make it right...

We calculate the magnetic field produced by the currents at left and at right using Ampere's law :

$$\oint_C \mathbf{B} \cdot d\mathbf{s} = \mu_0 i$$

We can write the current as:

$$i = \frac{dq}{dt}$$

$$q = CV$$

$$C = \epsilon_0 A/d$$

$$V = Ed$$

$$\Phi_E = EA$$

Displacement current

Maxwell proposed it, and it was confirmed.

$$\oint_C \mathbf{B} \cdot d\mathbf{s} = \mu_0 \epsilon_0 \frac{d}{dt} \int_S \mathbf{E} \cdot d\mathbf{A}$$

“Maxwell” equations:

$$\oint_S \mathbf{E} \cdot d\mathbf{A} = q / \epsilon_0$$

$$\oint_S \mathbf{B} \cdot d\mathbf{A} = 0$$

$$\oint_C \mathbf{B} \cdot d\mathbf{s} = \mu_0 \epsilon_0 \frac{d}{dt} \int_S \mathbf{E} \cdot d\mathbf{A} + \mu_0 i$$

$$\oint_C \mathbf{E} \cdot d\mathbf{s} = - \frac{d}{dt} \int_S \mathbf{B} \cdot d\mathbf{A}$$

Maxwell equations in free space:

$$\oint_S \mathbf{E} \cdot d\mathbf{A} = 0$$

$$\oint_S \mathbf{B} \cdot d\mathbf{A} = 0$$

$$\oint_C \mathbf{B} \cdot d\mathbf{s} = \mu_0 \epsilon_0 \frac{d}{dt} \int_S \mathbf{E} \cdot d\mathbf{A}$$

$$\oint_C \mathbf{E} \cdot d\mathbf{s} = -\frac{d}{dt} \int_S \mathbf{B} \cdot d\mathbf{A}$$

Maxwell, waves and light

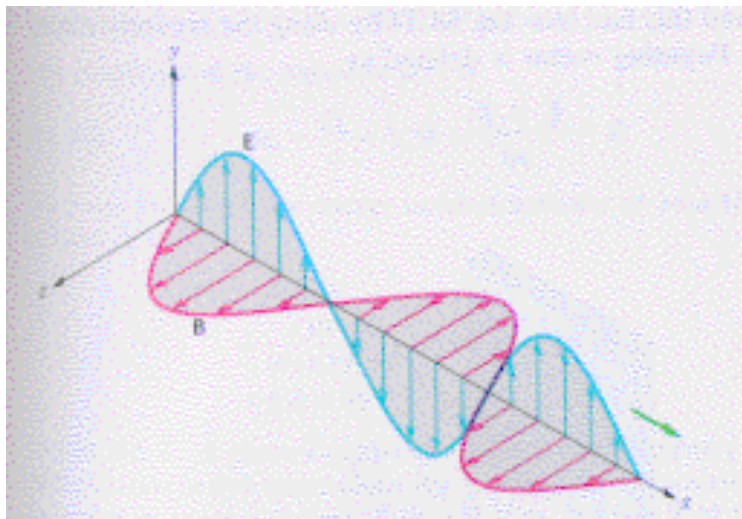

A solution to the Maxwell equations in free space is a “traveling wave”...

$$\begin{aligned}\mu_0 &= 1.256 \cdot 10^{-6} \text{ Tm/A} \\ \epsilon_0 &= 8.854 \cdot 10^{-12} \text{ C}^2/\text{Nm}^2 \\ [\mu_0\epsilon_0] &= (\text{Tm/A})(\text{C}^2/\text{Nm}^2) = \text{TsC/Nm} \\ &= (\text{Ns/Cm})(\text{sC/Nm}) \\ &= \text{s}^2/\text{m}^2\end{aligned}$$

$$\oint_C B \cdot ds = \mu_0 \epsilon_0 \frac{d}{dt} \int_S E \cdot dA \quad \oint_C E \cdot ds = - \frac{d}{dt} \int_S B \cdot dA$$

electric and magnetic “forces” can travel!

The velocity of the “Maxwell” waves is... $v = \frac{1}{\sqrt{\mu_0 \epsilon_0}} = 3 \cdot 10^8 \text{ m/s}$

The “electric” waves travel at the speed of *light*!?

Light itself is a wave of electricity and magnetism!?

A physics t-shirt!

$$\oint_S \mathbf{E} \cdot d\mathbf{A} = q / \epsilon_0$$

$$\oint_S \mathbf{B} \cdot d\mathbf{A} = 0$$

$$\oint_C \mathbf{E} \cdot d\mathbf{s} = -\frac{d}{dt} \int_S \mathbf{B} \cdot d\mathbf{A}$$

$$\oint_C \mathbf{B} \cdot d\mathbf{s} = \mu_0 \epsilon_0 \frac{d}{dt} \int_S \mathbf{E} \cdot d\mathbf{A} + \mu_0 i$$

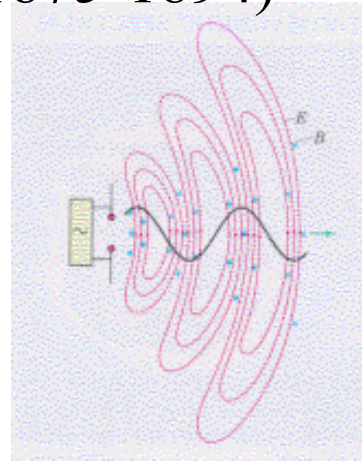

Electromagnetic waves

First person to prove that electromagnetic waves existed:

Heinrich Hertz (1875-1894)

Heinrich Hertz, *Portrait to his Mechanics (1894)*

First person to use electromagnetic waves for communications:

Guglielmo Marconi (1874-1937), 1909 Nobel Prize

(first transatlantic
commercial wireless
service, Nova Scotia,
1909)

How do waves travel?

Is there an ether they ride on? Michelson and Morley looked and looked, and decided it wasn't there. How do waves travel???

Electricity and magnetism are “relative”:
Whether charges move or not depends on which frame we use...

This was how Einstein began thinking about his “theory of special relativity”...

We'll leave that theory for later...maybe.
